# Custom reader for Exchangeable Image File Format (Exif) metadata tags

James Sturman  
Aurecon

# Context

- What are Exchangeable Image File Format (Exif) metadata tags?
- Field teams capturing site photos
- Keep a record of the Exif metadata as spreadsheet
- Convert the lat/long coordinates to local projections
- Load the data into GIS or Google Earth

AI	A	B	C	D	E	F	G

# Initial request

- Folder of jpg files
- Use jpg reader to expose Exif metadata
- Process using attribute specific transform e.g. AttributeProjector
- Write to csv file or spreadsheet
- Deliver

# Subsequent Requests

- Folder of raw image files
- No FME reader for this file type
- Converting from .dng to .jpg
- Can't deliver

# Options

- Code a tool in Python e.g. Piexif
- Call tool using the PythonCaller

Or...

- Command line tool
- ExifTool by Phil Harvey  
(<https://www.sno.phy.queensu.ca/~phil/exiftool/>)
- Should I build a custom reader?

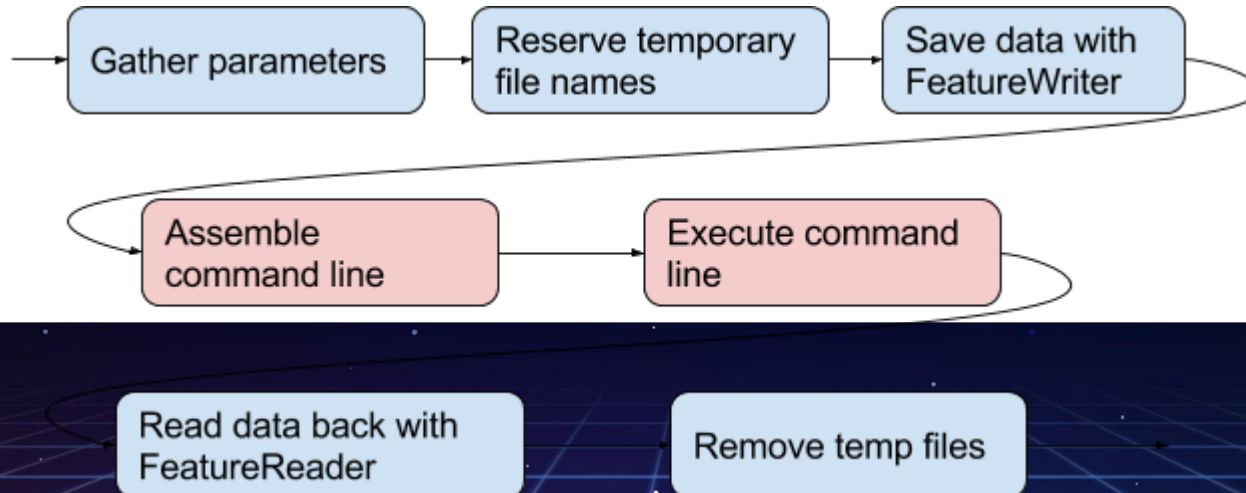

# What is the ExifTool?

- Platform independent Perl library and command line tool
- Reading, writing and editing Exif metadata information
- Supports a wide variety of file types including .dng
- Numerous output formatting options including csv and JSON
- Loads of extra bonus features
- Free software that can be redistributed

# How do you make a custom reader?

- Search the FME Knowledge Base or Google for “FME Custom Reader”
- Find article by Dimitri Bagh titled **Command Line Tools Integration**
- Review example FME workspaces

Create a single feature to drive the translation

Get file names and background color into attributes

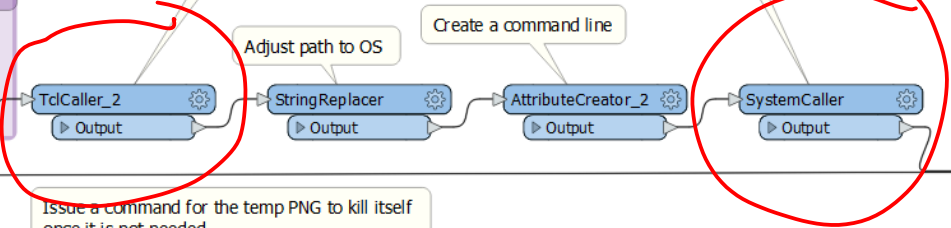

If the file set consists of more than one file, split by " "

Explode list to get a separate feature for each file

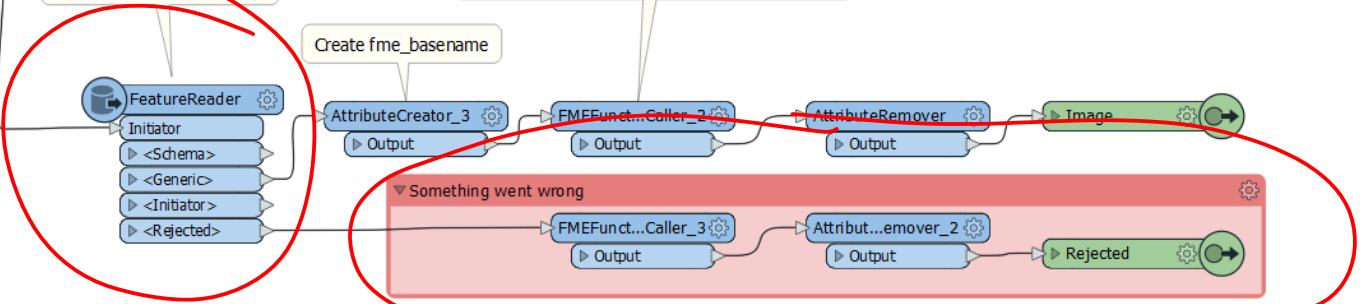

Reserve a temp name for each incoming feature

Execute command line.  
This will read all supplied SVG files and make PNG files in a temp location using provided parameters (density and background)

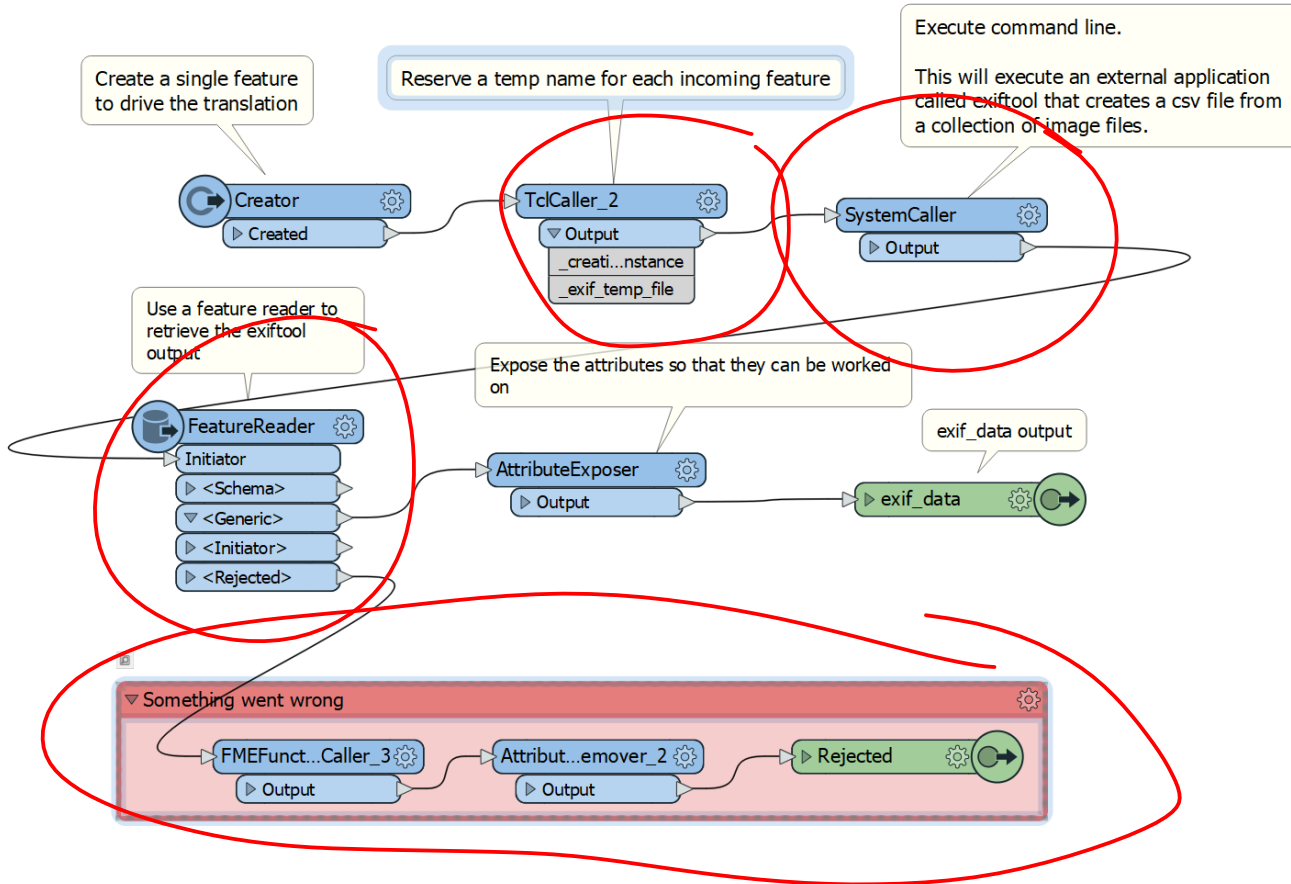

Read all the written images

Issue a command for the temp PNG to kill itself once it is not needed

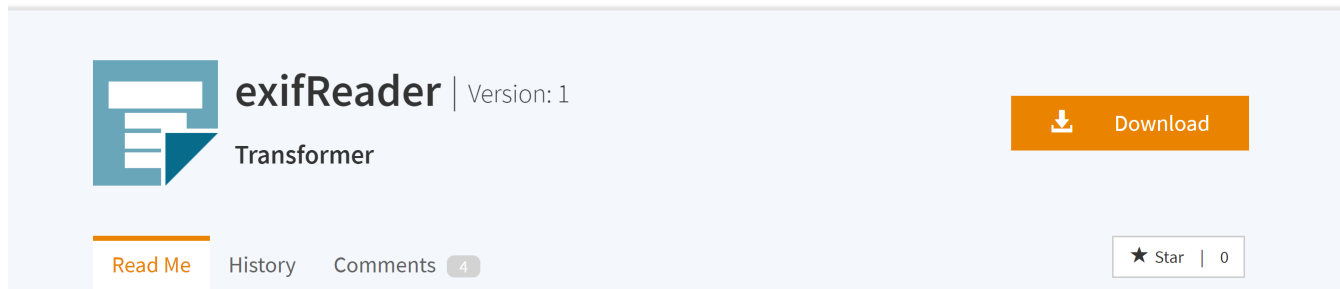

To use this transformer first download the exiftool and set your path environment variable so that the system can find the exiftool.exe executable. You can download the tool from <https://www.sno.phy.queensu.ca/~phil/exiftool/>

# Upload to FME Hub

- Tool shared on FME Hub
- Contribute to FME user community
- 121 downloads so far

The screenshot shows the FME Hub interface for the 'exifReader' transformer. On the left is a blue icon representing a document with a folded corner. To its right, the text 'exifReader | Version: 1' is displayed, with 'Transformer' below it. Further right is an orange button with a white download icon and the text 'Download'. Below the main title, there are three tabs: 'Read Me' (highlighted in orange), 'History', and 'Comments' (with a small grey circle containing the number '4'). On the far right of this section is a 'Star' button with a star icon and the text '0'.

# Generic exif metadata reader idea

- Submitted idea in the FME Knowledge Base
  - <https://knowledge.safe.com/idea/80259/exif-data-reader.html>

Idea by james · Oct 10, 2018 at 10:20 PM · exif readers 

## exif data reader

  5  

Rather than reading exif data from a specific image file format e.g. jpeg could a universal exif data reader be developed similar in functionality to the ExifTool by Phil Harvey. With the ExifTool you can point it at a directory, single file or a variety of file formats (supports approx. 186 formats) and it returns a table of image metadata. It works really well and I've created a FME custom transformer that makes a system call to the tool (<https://hub.safe.com/transformers/exifreader>). Other FME users might find this tool useful and it would be great as it's own reader.

Great suggestion -- separate the EXIF reading from the actual raster format. We'll look at this... Thanks.

# What's next?

- Additional functionality
- Exif metadata writer
- Perhaps a generic WMTS reader
